## Sectéra® vIPer™ PSTN Phone Now Certified for Use In Compartmented Information Facilities - SCIFs

**Product Name:** Sectéra® vIPer™ Universal Secure Phone

**Availability:** Immediate to qualified customers

**Web address:** [www.gdc4s.com/viper](http://www.gdc4s.com/viper)

The Sectéra® vIPer™ Public Switched Telephone Network (PSTN) phone has been Telephone Security Group (TSG) certified by the National Telecommunications Security Working Group, part of the Committee for National Security Systems, for use in secure areas including Sensitive Compartmented Information Facilities (SCIFs). Typically located within a building, SCIFs are secure areas that are used to process classified information.

### **Background:**

The Sectéra vIPer Universal Secure Phone provides the latest technology for both non-secure and secure, end-to-end Voice over Internet Protocol (VoIP) and PSTN networks. Using SCIP signaling technology and commercial open standards, the vIPer phone is the only VoIP phone with integrated security certified by the NSA to protect information classified Top Secret and below over commercial, wired VoIP networks, and is available to support multiple key-sets for U.S. government sponsored interoperability with NATO and coalition countries.

The vIPer phone is compatible with VoIP networks implemented using Cisco Skinny Call Control Protocol (SCCP). For military and government organizations planning to replace end-of-life STU-III or deployed STE phones, General Dynamics is offering a \$200 price discount for each vIPer Phone ordered as a replacement.
